

## 2.w Peter | Peer Review

In the peer review with Ali we did not have to talk about much we have not discussed in the variable exercises yet. There have been some difference in the way we wrote or code, but nothing that really affects efficiency/readability much, more personal preference.

### Set 1, Exercise 1

Ali used two print statements in his functions, while I only used one. This does not impact the code in any negative or positive way though, at least not as far as I can tell.

### Set 2, Exercise 4

While I used a for loop for the exercise, Ali did it manually. This is because we have not done for loops yet, so even tho it is a major difference, we won't take it into consideration in the code review. Ali had some difficulties when trying to combine to functions, but he managed to fix it himself before I could take a look at it.

Apart from that we did all the exercises in a very similar way. Sometimes we use different variables (or no variables at all, while the other one declares every value as a variable). The differences seem to be mostly the same as in the week 1 variable exercises. Ali told me he often forgot to put a semicolon at the end of his statements, since he is used to Python, but that was also ironed out when I got to look at his code.
