

2.w Peter | Peer Review

This week, I did my peer review with Natascha. It was the most interesting review as of yet.

Exercise 1

Natascha saved the values in variables while I just wrote them in directly.

Exercise 3

I just type-casted int instead of rounding the results. This is less accurate in some cases.

Exercise 4

I saved the individual pieces in variables, thinking it would make it more readable. At the end, I am not sure if it did.

Natascha told me that I can count the index by marking the desired span in IntelliJ. That really saves a lot of time.

Exercise 5

In this exercise, saving the values in variables makes it more readable.

Using substring at index of length - 1 instead of using charAt ensures that the value is a string. Otherwise one would have to convert it to a String separately.

Exercise 7

I used an Array instead of a list, just out of habit. Not sure if that is okay to do... Otherwise we pretty much did the same thing.
